NOTES

Flowering times are based on expected Victorian times south of the Great Dividing Range at about 200m above sea level. More northern latitudes (and full coastal) will flower earlier by up to a month, sometimes more. Higher altitudes will flower later by up to a month, sometimes more. If you have a species locally that is listed, use that as a baseline flowering time for your area.

DHA numbers are in parts per million and are the highest testing plant of each species from our testing in conjunction with the University of the Sunshine Coast.

MGO numbers are in parts per million and are given for interest only and as a maximum indication of possible levels from a monofloral planting. If half of the nectar comes from other non Leptospermum sources, the MGO will be half of that shown. MGO calculations are based on University of the Sunshine Coast information. Our breeding and testing program is ongoing.
